Purpose

This document explains the process and data required for integrating the WorkInSync system with client's own/third party access management vendors using a transfer of CSV files via a SFTP server.

What WorkInSync solves?

- Access management as a feature helps admins get a clear picture of the check in/out process that employees follow as a whole. Implementing this shows how well organizational policies are being followed.
- The seamless process of swiping access cards results in a very employee centric check in/out process that boosts adoption and adherence to utilization of resources.
- Admins can easily see the degree of utilization of office resources to see if they need to increase/decrease company space/resources via comprehensive reports.
- Highlight anomalies – WorkInSync can highlight anomalies by providing a list of users who entered the office without making a booking in a report.
- WorkInSync allows those users to check in who made a booking and reject the entry of folks who have not made a booking (*optional configuration*).
- WorkInSync also allows users to create a booking for employees who have not made a booking and check them in (*optional configuration*).

Prerequisite

- SSH (Secure Shell) Key
- IP addresses from where file will be sent for whitelisting.
- Encryption being used during file transfer (*if any*)
- Frequency of file to be shared [Eg: 1 hour] (*after SFTP configuration is done*)

Operating Procedure

- Once the client provides the above prerequisites, WorkInSync to configure the above and share the port, filepath and server details to the customer.
- Once the configuration has been done, the connection is to be tested.
- WorkInSync to share file format with the customer for employee swipe data, and ask the customer to push a sample file
- [File format](#)
